

Move More

Making Physical Activity Routine

Heart disease is the leading cause of death in the United States. The good news is that you can lower your risk of getting it or having a stroke by simply moving more. Many types of activity can help your heart—going on a hike or taking the stairs, biking to the store or around the block, wheeling yourself in your wheelchair. Figure out what works best for you.

How much is enough?

As little as 60 minutes a week of moderate-intensity aerobic activity such as walking briskly helps your heart. For major health benefits, aim for at least 150 minutes (2½ hours) a week. Or go for 75 minutes a week of more vigorous activity such as playing basketball, running, or jumping rope, which gives the same benefits. The bottom line: More activity means a bigger boost to your health.

It's up to you how you reach your own personal targets. For example, 30 minutes of physical activity, five times a week, is one option if you're aiming for 150 minutes a week.

Can't carve out a lot of time in your day?
Don't **chuck** your goal, **chunk** it!
Try 10 minutes a few times a day, for example.

Only have 10 minutes? Consider:

- ✓ Walking briskly for 5 minutes, turning around and walking back
- ✓ Dancing (standing or seated) to three songs
- ✓ Getting off your bus early and walking the last stretch

You'll know you're moving enough to help your heart if

- ✓ Your heart is beating faster
- ✓ You're breathing harder
- ✓ You break a sweat

Or, try the talk test:

- ✓ During physical activities, like brisk walking, you should be able to talk, but not sing.
- ✓ During activities such as jogging, you can't say more than a few words without pausing for a breath.

All adults should avoid inactivity.
Start gradually and increase slowly.
